

Helpful Tips:

1. Everything should be built using no tools.
2. You will have extra parts, those are spares.
3. Your first row is the most important, make sure your first row is very level and the rest will be easy.
4. If you are using Pipe and Drape, ensure it is properly designed, set up and sandbagged to hold the additional weight of the Pro-Scenes panels.
5. Looking for ideas on how to build a unique stage set with your Mod Scenes? Check out Modscenes.com/creations.

Step 1:

Use captive 4-way tie and 2-way tie connectors to truss, pipes or line sets.

(Continued)

Or use the Pipe and Drape Hangers to hang on top of standard pipe and drape. The Pipe and Drape Hangers are bendable and can bend to fit larger pipes. Make certain to bend all clamps back to their original shape before attaching panels.

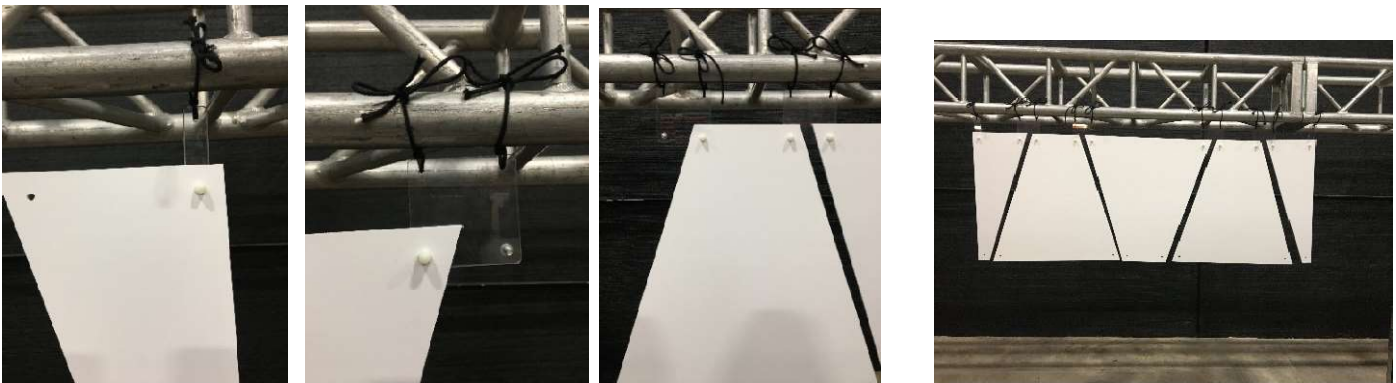

Step 2:

Attach your first row of design panels to your connectors. Simply slide your panel over the captive screws and tighten the connector and panel together with a cap nut.

Fully hang each panel before moving to the next. Please note that the hexagon edge pieces will always be used on the very edge of your panel wall.

Make sure your hangers are level to ensure a seamless build all the way to the floor.

(Continued)

Step 3:

Once your first row of panels is complete, add a row of 4 way connectors to the bottom of the top row of panels. Utilize the 4-way expanded connectors. Once this row of connectors is added, every bolt hole in the first row of panels should be filled.

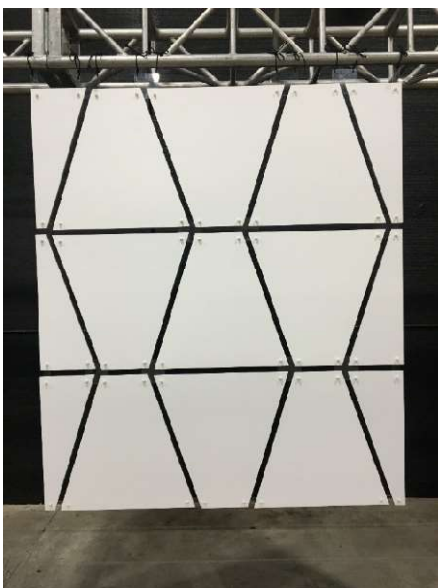

Step 4:

Hang the next row of panels to the connectors that were just added. The top of these panels will connect to the bottom of the previous row of connectors.

Step 5:

Repeat steps 3-4 until you reach your desired height.

(Continued)

Step 6:

To finish your last row, add 2-way connectors across the bottom section of your backdrop panels.

Step 7:

Enjoy your finished product.
